

Build Plan & Requirements

JewelryMallNG Website and WhatsApp AI System

Prepared for JewelryMallNG | By Hiddekel Studio | 3 September 2026 | JMNG-BP-0903 / v1.2

This is the plan for the JewelryMallNG website and WhatsApp AI system. It explains what we will build, how we will deliver it, what we need from you, and what it costs. A separate agreement will set out the full terms.

1. What you want

- A beautiful, easy online store that works for both retail and wholesale customers.
- Products with many colours, finishes, shapes, pack options, and quantity prices, without confusing the buyer.
- A WhatsApp assistant that handles routine questions and product discovery, then passes the conversation to a person when needed.
- The website, staff dashboard, and WhatsApp assistant use the same product, price, stock, order, and payment information.
- Clearer measurement of which social posts, adverts, and channels lead to enquiries and sales.
- A complete visual identity that feels recognisable, modern, and suitable for a growing jewelry brand.

The result

Customers can find the right product, see the correct price, place and pay for an order, and get help on WhatsApp. Staff can manage products, stock, orders, payments, and customer questions from one system.

2. What we will build

#	Area	What you receive
1	Complete identity design	Brand direction, logo system, colour palette, typography, profile assets, favicon, and a concise usage guide. The approved identity is applied to the website.
2	Online storefront	A mobile-first home page, collections, search and filters, product pages, cart, checkout, contact and essential policy pages.
3	Products and pricing	Product families, variations, images, mixed or fixed packs, minimum quantities, and automatic retail or wholesale quantity pricing.
4	Orders and payments	A complete order record, approved online payment, payment verification, customer confirmation, and order status history.
5	Stock, packing and delivery	Stock by product variation, stock-change history, low-stock warnings, packing list, and agreed delivery or pickup stages.
6	WhatsApp AI	Product and policy answers, catalogue links, image-assisted product matching, order guidance, approved order-status checks, and transfer to staff.
7	Staff dashboard	Product, price, stock, order, payment, customer, conversation, staff access, and basic report controls.
8	Tracking and reports	Track where website visits and WhatsApp enquiries come from, including Instagram and TikTok links, and show sales, product, channel, and staff-transfer reports.
9	Testing and launch	Phone and computer testing, staff-access checks, test payments, monitoring, backups, a backup restore test, launch, training, and handover.

3. How the buying journey works

Step	What the customer does	What the system does
Discover	A shopper arrives from Instagram, TikTok, WhatsApp, or a shared product link.	The source is recorded where the channel permits it.
Choose	She selects a product, variation, pack, and quantity.	The system calculates the approved price and checks availability.
Order	She reviews the cart, chooses delivery or pickup, and enters her details.	One order reference keeps every item, amount, and status together.
Pay	She uses the approved online payment method.	The system verifies the payment through the provider before marking the order paid.
Receive	She receives updates while the order is prepared and delivered or collected.	Staff prepare the order and every status change is recorded.

4. How the WhatsApp AI works

The assistant is connected to the website and staff dashboard. It uses the same approved product, price, stock, order, and policy information.

It can	It will not
Answer approved product, price, pack, delivery, pickup, and order questions.	Invent a product, price, stock level, delivery date, discount, or payment result.
Search the live catalogue and send the correct product or cart link.	Treat a screenshot alone as final proof of payment.
Compare a customer image with catalogue images and suggest likely matches.	Pretend an image match is certain when confidence is low.
Check a safe order status after the required identity check.	Approve refunds, special discounts, credit, or policy exceptions.
Summarise the conversation and hand it to a staff member.	Reveal another customer's information or sensitive internal data.

When staff take over

Complaints, refunds, payment disputes, unusual delivery requests, questions the assistant is not sure about, and any customer who asks for a person are sent to staff. The staff member receives the conversation context so the customer does not have to start again.

5. What complete identity design means

- A short brand discovery session covering audience, personality, competitors, and the impression JewelryMallNG should create.
- Two distinct identity directions for review, followed by refinement of one approved direction.
- Main logo, secondary logo layout, icon or monogram, light and dark versions, and practical file formats.
- Approved colours and fonts, image style, social profile image, highlight-cover style, and website application.
- A concise identity guide covering spacing, colour, logo use, typography, and common mistakes to avoid.

This covers the core digital identity. Product packaging, printing, photography, physical signage, and an ongoing social-media design service are not included unless added in writing.

Identity step	What happens
Brand brief	Agree the audience, personality, competitors, practical uses, and visual goals.
Choose a direction	Present two clear options, compare them, and choose one.
Final identity	Improve the selected option, prepare the logo files and other key items, write the usage guide, and apply the identity to the website.

6. Three-week delivery plan

The three-week clock starts after the initial payment, infrastructure funding, core account access, catalogue sample, and one person who can approve decisions are available. Some tasks happen at the same time, but the full agreed system is delivered as one project.

When	Focus	Expected outcome
Days 1 to 3	Requirements and identity	Confirm products, pricing, payment, packing and delivery, WhatsApp access, the brand brief, and the test list. Present identity options.
Days 4 to 10	Commerce and operations	Build the identity, storefront, variations, pricing, cart, checkout, payments, inventory, orders, and dashboard.
Days 8 to 15	WhatsApp AI	Connect the assistant to products and orders. Add image matching, safety rules, transfer to staff, and conversation records.
Days 16 to 19	Testing the full system	Load agreed information and test buying, payments, staff access, WhatsApp cases, phone use, speed, backups, and recovery.
Days 20 to 21	Launch and handover	Correct agreed defects, deploy, train staff, hand over access and notes, and begin 30-day support.

Conditions for three-week delivery

One person who can approve decisions, a usable catalogue sample on day one, one clear set of feedback within 24 hours, and timely provider access. A client-input or provider-approval delay moves the dependent date; it does not reduce the agreed work.

7. What we need from you

- Correct business details, one decision-maker, and replies within the agreed review window.
- A sample of the 10 to 20 most complex products, with images, variations, stock, prices, pack rules, and wholesale thresholds.
- Delivery areas, pickup process, delivery-fee rules, fulfilment stages, exchange, return, cancellation, and refund policies.
- Access to the chosen domain, Meta Business assets, WhatsApp number, payment provider, and any current catalogue or website assets.
- Approved FAQs, service tone, escalation rules, staff roles, permission to use supplied materials, and timely identity approval.

8. Testing and handover

Before launch, we test approved products and quantity prices, payment, stock changes, permissions, fulfilment, WhatsApp answers and escalations, mobile layouts, monitoring, and a backup restore. After full payment, JewelryMallNG receives the system, source and brand files, administrative and provider access, operating notes, and live training. The detailed acceptance checklist is attached to the service agreement.

9. Costs

The service fee and the infrastructure allowance are shown together so the first-year commitment is clear. Infrastructure is purchased at supplier cost and carries no markup.

Item	What it covers	Amount
Complete service fee	Identity design, website and sales system, staff dashboard, WhatsApp AI, connections to approved services, testing, launch, training, handover, and 30 days of support.	₦1,000,000
First-year infrastructure allowance	netcup RS 1000 G12, one ordinary Cloudflare-registered .com domain, and a small launch allowance for off-site storage or transactional usage.	₦270,000
Estimated first-year project total	Complete service fee plus the estimated infrastructure budget.	₦1,270,000

How infrastructure payments are handled

The ₦270,000 is the maximum amount approved based on current supplier prices, VAT treatment, exchange-rate movement, and card charges. Actual provider receipts are checked against this amount. Unused funds are credited or returned. Any amount above it requires approval before purchase.

Proposed payment schedule

- Start: ₦770,000, made up of the ₦500,000 service deposit and ₦270,000 infrastructure allowance.
- Working-system review: ₦250,000 when the connected system is presented for the agreed review.
- Launch and handover: ₦250,000 after agreed defects are corrected and before final source, credentials, and handover are released.

Costs based on use

WhatsApp business messages sent outside the normal customer-service reply period, AI use, payment-processing fees, and any storage above the free allowance depend on real activity. They are not hidden inside the service fee. JewelryMallNG pays the providers directly at cost. The separate Infrastructure Costs document explains what is fixed, what is free, and what changes with usage.

10. Support and what is not included

The project includes 30 days of support after launch for problems in the delivered work and guidance on using the system. New features, ongoing server administration, content entry beyond the agreed launch load, and changes caused by a new provider policy are separate work.

Instagram and TikTok messaging automation, advertising, campaign management, regular content creation, product photography, packaging design, printing, logistics operations, and a native mobile app are excluded. They can be priced separately later.

11. What happens next

Confirm the proposal details, domain name, payment method, catalogue and wholesale rules, staff roles, and the person approving the work. We then issue the service agreement and detailed testing checklist. Once they are signed and the start payment is received, the three-week delivery begins.
